## ABSTRACT

Microblogging services like twitter posts tweets based on people's daily life, entertainment, political and any other information field. user's face problem in finding their own interest of tweets posts by followees due to more number of posts are posted on various field and also user can't find tweets of his own interest due to short text representation.

This project proposed a new approach to find the tweets interested to view by an user using clustering and labeling methods. By accepting topic it provides clusters for subtopics with labeling name from an clustered values corresponding to sample tweets collected dynamically from an twitter account.
