SCHEME

1. Answer: Option B

2. Answer: Option D

Friend keyword is written inside one class (class a) to inform the same class (class a) that another class (class b) can access the private data of the other (class a).

eg: class a class b

```
{ {  
private: int e; private: int f;  
public: int x;  
friend class b;  
}
```

In the above example, class b can access the private data of the class a.

3. Answer: Option B

4. Answer: Option A

```
void PrintValues(int nValue1, int nValue2=10)
```

```
{  
using namespace std;  
cout << "1st value: " << nValue1 << endl;  
cout << "2nd value: " << nValue2 << endl;  
}
```

```
int main()
```

```
{  
PrintValues(1); // nValue2 will use default parameter of 10  
PrintValues(3, 4); // override default value for nValue2  
}
```

output

```
1st value: 1  
2nd value: 10  
1st value: 3  
2nd value: 4
```

In the first function call, the caller did not supply an argument for nValue2, so the function used the default value of 10. In the second call, the caller did supply a value for nValue2, so the user-supplied value was used.

5. Answer: Option D

Whereas option (D) is correct. Because it isn't possible to declare constructor as either private or protected. It must be declared as public. Hence the statement of option (D) is totally correct.

Here the correct answer of question (19) is:

D. Constructor of a class cannot be private.

17. Answer: Option C

In has a relationship some members may take from another class.

In Kind of relationship all members are derived or take from another class. Because in hierarchical form some class is inherited so it derived all members but if in one class create another class object and use members of another class so it's a different thing.

Kind of relationship example

```
class Bike
{
    Engine objEng;
};
class Engine
{
    float CC;
};
```

18. Answer: Option D

19. Answer: Option C

20. Answer: Option C

21. Answer: Option D

Compiler errors mean the compiler could not translate the source code you provided into object code. It usually means you have a syntactic or semantic error in your own program that you have to resolve before your program exhibits the behavior you're intending it to have.

Linker errors mean the linker could not build an executable program from the object code you provided. It usually means your program does not properly interface with its own dependencies or with the outside world (e.g. External libraries).

Objects are the entities which exhibit both state and behaviour. Each object consists of data code to manipulate the data. The word instance is the synonym for the object. An instance of the class is called object.

3. Answer: Option D

4. Answer: Option C

Paging is a memory mgmt scheme in which memory is divided into fixed size blocks of memory known as pages. When we execute a program the pages containing the required data are loaded in the main memory. The no. of pages that can be loaded in the main memory is fixed. So when a process asks for the data which is not in the memory at the moment the page fault occurs and then the pages with required data are loaded from the memory.

5. Answer: Option C

Explanation:

The Banker's algorithm is a resource allocation & deadlock avoidance algorithm developed by Edsger Dijkstra that tests for safety by simulating the allocation of pre-determined maximum possible amounts of all resources, and then makes a "safe-state" check to test for possible deadlock conditions for all other pending activities, before deciding whether allocation should be allowed to continue.

6. Answer: Option D

7. Answer: Option A

Explanation: A constant pointer is the one whose pointing location is fixed and can't be modified.

8. Answer: Option D

9. Answer: Option D

Compiler errors mean the compiler could not translate the source code you provided into object code. It usually means you have a syntactic or semantic error in your own program that you have to resolve before your program exhibits the behavior you're intending it to have.

Linker errors mean the linker could not build an executable program from the object code you

17. Answer: Option B

18. Answer: Option A

19. Answer: Option A

20. Answer: Option D

21. Answer: Option A

Explanation:

Step 1: `int y=128;` The variable 'y' is declared as an integer type and initialized to value "128".

Step 2: `const int x=y;` The constant variable 'x' is declared as an integer and it is initialized with the variable 'y' value.

Step 3: `printf("%d\n", x);` It prints the value of variable 'x'.

Hence the output of the program is "128"

22. Answer: Option A

Explanation:

True, A function may have any number of return statements each returning different values and each return statements will not occur successively.

24. Answer: Option C

Explanation:

The function `strstr()` Finds the first occurrence of a substring in another string

Declaration: `char *strstr(const char *s1, const char *s2);`

Return Value:

On success `strstr` returns a pointer to the element in `s1` where `s2` begins (points to `s2` in `s1`).

On error (if `s2` does not occur in `s1`), `strstr` returns null.

Example:

```
#include <stdio.h>
#include <string.h>

int main(void)
{
    char *str1 = "IndiaBIX", *str2 = "ia", *ptr;

    ptr = strstr(str1, str2);
    printf("The substring is: %s\n", ptr);
    return 0;
}
```

Output: The substring is: aBIX

25. Answer: Option C

Explanation:

Declaration: `strcmp(const char *s1, const char *s2);`

The `strcmp` return an int value that is

if `s1 < s2` returns a value `< 0`

if `s1 == s2` returns 0

if `s1 > s2` returns a value `> 0`
