ABSTRACT

Petroleum usage and petroleum sourced fuels is considered as unsustainable because of the enormous contribution of petroleum for the accumulation of carbon dioxide in the environment. Release of carbon dioxide to the environment is a problem which will have a very bad effect on the environment and human population. An alternative for the usage of petroleum is a trend in today's world. Various methodologies and innovative solutions have been developed and are in development for the alternative source of petroleum. This current work deals with the production of biodiesel from a commonly grown microalgae namely *Isochrysis galbana*. This microalga was used as food for fish and now can be applied for the production of fuels. The principles of gas chromatography are used for the separation of compounds having fuel potential for the production of fuels.

Keywords: petroleum usage; fish food; Isochrysis galbana; gas chromatography
